

Not all antibody tests are created equal

High quality, extensive reach and targeting the right protein are all essential to ensure we effectively manage the threat of COVID-19

The SARS-CoV-2 Total Assay¹ is a highly sensitive and accurate antibody test

A total antibody test enables a **clearer clinical picture** over longer period of time.

What is sensitivity and specificity?

A highly sensitive test should capture nearly all true positive results. A highly specific test should avoid nearly all false positive results.

100% sensitivity²

99.8% specificity³

Total antibody blood tests, which run on laboratory analyzers, detect antibodies to SARS-CoV-2 (including IgG and IgM), that are used to identify those with an immune response that indicates recent infection or prior exposure.

Rapid

Identify SARS-CoV-2 antibodies in as little as 10 minutes.⁵

1. This test has been authorized for sale by Health Canada under the Interim Order Respecting the Importation and Sale of Medical Devices for Use in Relation to COVID-19, and has not been licensed under the Health Canada Medical Devices Regulation. This test has been authorized only for the detection of antibodies to SARS-CoV-2, not for any other viruses or pathogens. This test is only authorized for the duration of the Interim Order, for a period of up to one year, unless it is renewed or unless the authorization is cancelled sooner. Product availability may vary by country and is subject to varying regulatory requirements.
 2. For samples collected ≥ 14 days after positive PCR results.
 3. Based on results for the ADVIA Centaur COV2T assay.
 4. Installed base of ADVIA Centaur XP, ADVIA Centaur XPT, ADVIA Centaur CP, Atellica Solution, Dimension Vista and Dimension EXL analyzers.
 5. Dependent on text mix and configuration using Atellica Solution.

Delivering long-term value as we look toward immunity and vaccination

The test detects antibodies to a key protein on the surface of the virus – a **spike protein**, which binds the virus to cells via a distinct human receptor (ACE2) found in lungs, heart, and multiple organs.

Studies indicate that certain (neutralizing) antibodies to the spike protein can **disarm SARS-CoV-2**, presumably by interfering with the ability of the virus to bind, penetrate and infect human cells.
