A comprehensive, step-by-step surgical guide to managing temporal lobe epilepsy

As arguably the most complex lobe of the brain, all the regions of the temporal lobe require a high level of anatomical and functional knowledge to conduct safe and effective surgical operations. This unique resource covers diverse surgical resection techniques commonly used to treat temporal lobe epilepsy (TLE).

Anatomy, Techniques, and Approaches in Temporal Lobe Surgery: A Step-by-Step Guide edited by Drs. Ali Tayebi Meybodi, Mark C. Preul, Kris A. Smith, and Michael T. Lawton augments hands-on learning attained from cadaver training, with state-of-the-art contributions from renowned pioneers in neuroanatomy and neurosurgery.

The book starts with an introductory chapter on the history of TLE surgery, followed by two chapters that detail functional and surgical anatomy, respectively. The seven procedural chapters meticulously and systematically depict how to perform current TLE surgical approaches through succinct discussion, surgically oriented views, figures, and accompanying videos. While this book eloquently bridges the gap between didactic text and the operating room, the authors emphasize the importance of neurosurgical training laboratories, in-depth study, and practicing temporal lobe procedures on cadavers.

Key Highlights

- Detailed cadaveric dissections and impressive illustrations by Laura Roy focus on bony, meningeal, vascular, and neural elements that elucidate the surgical anatomy of the temporal lobe
- Various procedures illustrated via high-resolution 3D immersive images precisely replicate each operative step
- Narrated videos demonstrate specific surgical techniques to enhance learning and understanding of operative approaches

This must-have reference provides invaluable guidance and insight for neurosurgical trainees and practicing neurosurgeons to manage and navigate the anatomical and operative complexities associated with temporal lobe epilepsy.

Dehdashti/Gardner

The Video-Based Atlas of Modern Cavernous Sinus Surgery

2026.

approx. 254 pp., approx. 290 illus., softcover

5.000 X 8.000 IN

ISBN 978-1-68420-609-4 (Print)

Publication date: December 9, 2026

RRP approx. 205,00 € [D]

RRP approx. US\$ 225.00

also available as eBook

A 360-degree, multidisciplinary approach to treating cavernous sinus lesions and tumors

Due to refinement of existing approaches and development of new ones, the cavernous sinus is no longer a barrier to surgical intervention. Nonetheless, this critical skull base region contains densely packed oculomotor and sensory nerves and the internal carotid artery, requiring extensive anatomical knowledge and experience. The *Video-Based Atlas of Modern Cavernous Sinus Surgery*, edited by renowned skull-base neurosurgeons Amir R. Dehdashti and Paul A. Gardner, reflects the latest evidence-based knowledge, with contributions from multidisciplinary experts in the field.

Throughout 20 succinctly written chapters and nearly 50 videos, this unique resource encompasses all aspects of cavernous sinus surgery. Detailed anatomy and meticulous descriptions of various procedures for vascular lesions and tumors cover transcranial, endonasal, and transorbital approaches, as well as the role of radiation treatment. Discussion of complex decision making, diverse strategies, technical pearls, and 360-degree access to the cavernous sinus guides readers through managing this highly challenging anatomical space.

Key Features

- Internationally recognized experts share cutting-edge techniques and surgical nuances for safe exposure and treatment
- Videos enhance understanding of new surgical approaches that result in improved outcomes and decreased morbidity
- Operative photos highlight patient positioning and steps involved in surgical procedures

This is an essential reference for veteran and trainee neurosurgeons, otolaryngologists, maxillofacial, oculoplastic, plastic and reconstructive, and vascular surgeons.

The quintessential medical and surgical guide to managing lacrimal and dry eye disorders

Lacrimal and Dry Eye Disorders: A Complete Guide is a comprehensive textbook providing state of the art information regarding the underlying causes and management of watering and dry eyes, which together form the dual ophthalmic specialty of dacryology. Edited by world-renowned dacryology experts Jane Olver, Daniel Rootman, Reynaldo Javate, Hunter Yuen, and Ulrich Lachmund, this one-stop resource covers the basic science, clinical assessment, and advanced management of watering and dry eyes.

The text reflects advances in our understanding of disease, and both minimally and more conventional surgical management of dry and watering eye disorders. This comprehensive approach includes pathology related to the eyelids, tear film, ocular surface and cornea in addition to the lacrimal outflow system and the role of systemic health in dacryologic disease. Throughout eight systematically organized sections and 82 chapters, this unique reference encompasses everything about tears, from start to finish including discussion of lacrimal history and histology, causes and presentation of lacrimal disorders, surgical options for lacrimal disease, as well as pathobiology, histology, prevention, and both topical and more invasive management of dry and watering eye diseases.

Key Highlights

- Comprehensive coverage of tear production and drainage conditions and management from a diverse group of leading global authorities
- The latest surgical techniques and therapeutic options for aqueous-deficient and evaporative dry eye, eyelid disorders relating to watery and dry eyes, and lacrimal drainage disorders
- Advances in the therapeutic, mechanical, and heat and light energy treatments for dry eyes

This text is essential reading for ophthalmologists, oculoplastic and lacrimal surgeons, corneal and external eye disease specialists, ENT surgeons, optometrists, and all clinicians interested in improving outcomes for patients with watery and/or dry eyes.

Thieme Publishers New York Returns Policy

EFFECTIVE JANUARY 1ST, 2021

General Remarks

- All returns require prior permission, and need to be authorized
- All returns must be accompanied by the Authorizations form, as well as a copy of the invoice and packing slip, and must have been purchased directly from Publisher.
- A return will not be accepted without the correct accompanying paperwork.
- Trade partners must send written Requests to Return; the returned product has to correspond to the Request.
- Returns for credit must be within 18 months of invoice date.
- A book declared OP (Out of Print) must be returned within 3 months of the date of Publisher Notification and purchased within the last 12 months.
- Transit-damaged claims – where the damage occurred during the initial shipping from the publisher's warehouse to the original customer must be claimed within 30 days of invoice date.
- Any book with a damaged scratch-off code, or where digital ancillaries (CD-ROMs, DVD-ROMs) have been removed will not be accepted as a credited return.
- Short shipment claims must be accompanied by documentation (packing list, etc.) that validates and supports the claim.
- To receive a credit, returns must be in saleable condition. Damaged or unsaleable books will not be credited.
- Damaged is defined as a book that has been bent, dinged, broken, scratched, dented, or torn.
- No return will be given for offline electronic or audio visual material, including eBooks.

For any further questions, trade customers in North, South and Central America should contact customerservice@thieme.com
