Plastic and Metal Materials for Additive Manufacturing
Systematic Approach

We always see the big picture to let you achieve the best possible result. This is why all our materials are optimised for our systems — and vice versa.

Stronger Together

The development of our systems, powder materials and process parameters go hand in hand — all three elements are ideally aligned. The result: parts with first-class properties for their respective application, and thus ideally suited for cost-effective production.
Discover the optimal materials that turn ideas into possibilities – and possibilities into results.

A wealth of materials
EOS offers you a comprehensive range of plastic and metal materials for Additive Manufacturing. Material data sheets available online provide extensive information about the component properties that can be achieved.

Materials expertise
Our materials engineers have been continuously developing new materials for more than 20 years to support our customers in implementing their projects. This expertise is incorporated into every new development in order to meet the requirements of the different industries. The materials are subject to quality assurance in compliance with international standards.

What you want
For us, it is important that our portfolio contains precisely the materials that you need to implement your applications. As a result, new developments and enhancements at EOS evolve from customer requirements.

Only the best is good enough
For you, this means: high-quality, extensively tested materials that enable you to achieve your design, development and production goals.
EOS offers 16 materials for Additive Manufacturing with plastics, which meet a wide range of different component requirements: filled and unfilled polyamides (PA), thermoplastic elastomers (TPE), polyether ketone (PAEK) and polystyrene (PS). We provide advice and support to help you select the materials based on the property profiles required for your components.

EOS plastic materials can be used to produce innovative components in accordance with the most rigorous industrial standards. Moreover, they are essential to enhancing the overall flexibility of your production processes, and open up virtually unlimited flexibility of development and design.

For detailed technical information on our plastic materials and property profiles, visit the EOS materials database: http://eos.materialdatacenter.com/eo/en

The right powder for any application
Each material is characterised by specific material properties that optimally support the property profiles required by your products. Strength, impact resistance, temperature, dimensional stability — EOS materials can comply with all requirements known to us.

Among our sustainability activities, we are preparing to offer a polymer powder recycling program. After collection is arranged, the material is processed for use in non-laser sintering applications, thus ensuring full recycling of EOS polymer materials.

* EOS systems are able to manufacture medical devices. However, EOS cannot offer any guarantee that these devices meet all requirements.
EOS offers a wide range of materials that can be used in many industries. The part properties are ensured from one system generation to the next. You can make flexible and optimum use of the EOS technology with DMLS® (Direct Metal Laser Sintering) for your specific applications. At the end of the day this means competitive advantages for you thanks to favourably priced high-end metal parts.

Metal components can be manufactured with first-class quality by means of Direct Metal Laser Sintering (DMLS®). The reliable part quality is demonstrated by defined mechanical properties to a reproducible quality standard.

For detailed technical information on our metal materials, visit: http://www.eos.info/material-m

Unique quality assurance of material batches
Batch-specific factory certificates confirm both the standard chemical properties and grain size distribution as well as the tested material properties of the laser sintered material and the tolerances established during testing.

A database of the powder and part properties measured during the quality assurance process documents the performance capacity of the entire supply chain.
Think the impossible. You can get it.
